

## ABSTRACT OF THE DISCLOSURE

A scrapbooking instrument set comprises three elongated hole punches of different bit sizes and three elongated setters of different bit sizes, each hole punch and setter of substantially identical size and shape except for the bits. The hole punches and setters are arranged in a base, in a circle around a larger mounting tool configured with an axially extending hole of identical radial shape and slightly larger radial size as the hole punches and setters, such that the hole punches and setters each fit inside the tool. The base contains holes into which the hole punches, setters and mounting tool fit, such that the hole punches, setters and mounting tool are stored vertically in the base. A transparent cover screws onto the base to protect the instruments stored therein while allowing them to be displayed.
